

ABSTRACT

A production protection system dealing with digital contents that are digital production includes obtaining means, first content decryption means, and second content decryption means. The obtaining means
5 obtains data including a first content, on which first encryption has been performed, and a second content, on which second encryption has been performed. The second encryption is more difficult to decrypt than the first encryption. The first content decryption means decrypts
10 the first content in the obtained data using a first decryption method. The second content decryption means decrypts the second content in the obtained data using a second decryption method, which is more complicated than the first decryption method.
